ESSENTIAL QUESTION(S): How can we determine if the model for a function should be discrete or continuous?

REVIEW:

1. The Library of Congress in Washington D.C. is considered the largest library in the world. They often receive boxes of books to be added to their collection. Since books can be quite heavy, they aren’t shipped in big boxes. If, on average, each box contains about 8 books, how many books are received by the library in 6 boxes, 10 boxes, or n boxes?
   a. Use a table, a graph, and 2 equations to model this situation.
   b. Describe using a sentence the domain of the function.

2. Many of the books at the Library of Congress are electronic. If about 13 e-books can be downloaded onto the computer each hour, how many e-books can be added to the library in 3 hours, 5 hours, or n hours (assuming the computer memory is not limited)?
   a. Use a table, a graph, and 2 equations to model this situation.
   b. Describe using a sentence the domain of the function.
3. The librarians work to keep the library orderly and put books back into their proper places after they have been used. If a librarian can sort and shelve 3 books in a minute, how many books does that librarian take care of in 3 hours, 5 hours, or n hours? Use a table, a graph, and 2 equations to model this situation.

4. Would it make sense in any of these situations for there to be a time when 32.5 books had been shipped, downloaded into the computer, or placed on the shelf?

5. Which of these situations (in problems 1-3) represent a discrete function and which represent a continuous function? Justify.

6. A giant piece of paper is cut into three equal pieces and then each of those is cut into three equal pieces and so forth. Just counting the pieces after each turn, not in between the turns, how many papers will there be after a round of 10 cuts? 20 cuts? n cuts?

   a. Use a table, a graph, and 2 equations to model this situation.
b. Describe using a sentence the domain of the function

c. Would it make sense to look for the number of pieces of paper at 5.2 cuts? Why?

d. Would it make sense to look for the number of cuts it takes to make 53.6 papers? Why?

7. Medicine taken by a patient breaks down in the patient's bloodstream and dissipates out of the patient's system. Suppose a dose of 60 milligrams of anti-parasite medicine is given to a dog and the medicine breaks down such that 20% of the medicine becomes ineffective every hour. How much of the 60-milligram dose is still active in the dog's bloodstream after 3 hours, after 4.25 hours, after n hours?
   a. Use a table, a graph, and 2 equations to model this situation.

b. Describe using a sentence the domain of the function

c. Would it make sense to look for an amount of active medicine at 3.8 hours? Why?

d. Would it make sense to look for when there is 35 milligrams of medicine? Why?
8. Which of the functions modeled in #6 and #7 are discrete and which are continuous? Why?

9. What needs to be considered when looking at a situation or context and deciding if it fits best with a discrete or continuous model?

10. Describe the differences in each representation (table, graph, and equation) for discrete and continuous functions.

Table:

Graph:

Equation:

11. Which of the functions modeled above are linear? Which are exponential? Why?
