

Rhino Horn

Adaptations

Rhinos do not have good eyesight but that doesn't matter because of their keen sense of smell and hearing. They have big white horns made of ivory to defend themselves by charging and attacking their predators like lions and hyenas.

Rhinoceros

The Rhino

By Jack

Human Interactions

Humans do interact with rhinos. Rhinos try to keep as far away as they can from humans. Rhinos are an illegal animal to kill. When you kill an animal that is illegal to kill it is called poaching, but that's just what humans do to rhinos. So that is a negative interaction. It can be fixed by setting up foundations to help save rhinos and sending rhinos to a location where humans can not enter and if they do they will be fined or arrested. They can also hire people to watch rhinos and if they see any signs of poaching they will report it immediately.

Characteristics

A rhinos scientific name is Rhinocerotidae. There are five different species and one is *Diceros bicornis* and that is the black rhinos species. A rhino is the second largest land animal and weighs up to 6,000 pounds. Rhinos are herbivores which mean they only eat plants such as grass and leaves. The average rhino can be as tall as 5 feet up to the shoulder. They also have

Ecosystem

An ecosystem is a place where living and non-living things interact with each other. The Rhino lives in grasslands and open savannas. They are mostly around savannas. Those savannas are mostly filled with dry dirt, some dead grass, shrubs, and do not have enough rain. Savannas are hot and many animals that live there die from not enough water. Many of the animals in a rhino's ecosystem get along fine with the rhino except for lions, hyenas, and so some-
